Infrastructure development plan

Investment plan

The airport development plan is based on the traffic figures forecasted for the concession period ('23-'53), which estimate to reach 2.2 Mpax at PLS by 2053

PLS Traffic forecast (Mpax)

|               | CAGR '19-'23 | CAGR '23-'30 | CAGR '30-'40 | CAGR '40-'53 | CAGR '23-'53 |
|---------------|--------------|--------------|--------------|--------------|--------------|
| Dom           | -6.9%        | 12.6%        | 3.8%         | 2.2%         | 5.1%         |
| Caribbean     | -0.5%        | 4.2%         | 0.6%         | 0.5%         | 1.4%         |

Introduction

**Current infrastructure condition & compliance**

Capacity-demand analysis

Infrastructure development plan

Investment plan

Providenciales Airport (PLS) is a code 4E airport with a RWY of 9,200 x 148 ft, no parallel taxiway, a 92,322 ft<sup>2</sup> commercial passenger terminal and 3 FBOs

### Providenciales International Airport Layout

| Providenciales Airport (PLS) |                           |                |
|------------------------------|---------------------------|----------------|
| Elevation / Temperature      | 6 m / 32°C                |                |
| Approach type                | Visual and non-instrument |                |
| Operating hours              | 06:00 - 20:00, local time |                |
| RWY 10-28                    | Dimensions                | 9,200 x 148 ft |
|                              | Strip                     | 9,593 x 492 ft |
|                              | RESAs                     | 787 x 492 ft   |

# An initial assessment based on ICAO's Annex 14 shows that PLS is compliant with ICAO standards

## Preliminary analysis of compliance works related to the requirements of ICAO's Annex 14

**ICAO Annex 14**  
Volume I: Aerodrome Design & Operations  
*Eighth Edition, July 2018*

- Compliance of the current airport infrastructure status and operation has been assessed for each airport system and subsystem with respect to ICAO's Annex 14 standards and recommendations
- Overall, the airport is compliant with ICAO's SARPs
- A summary of the compliance of each of the main systems/subsystems is presented in the indexed list on this slide
- A detailed analysis of each subsystem is presented in the next slides
- A first analysis shows that no non-compliances have been found in PLS

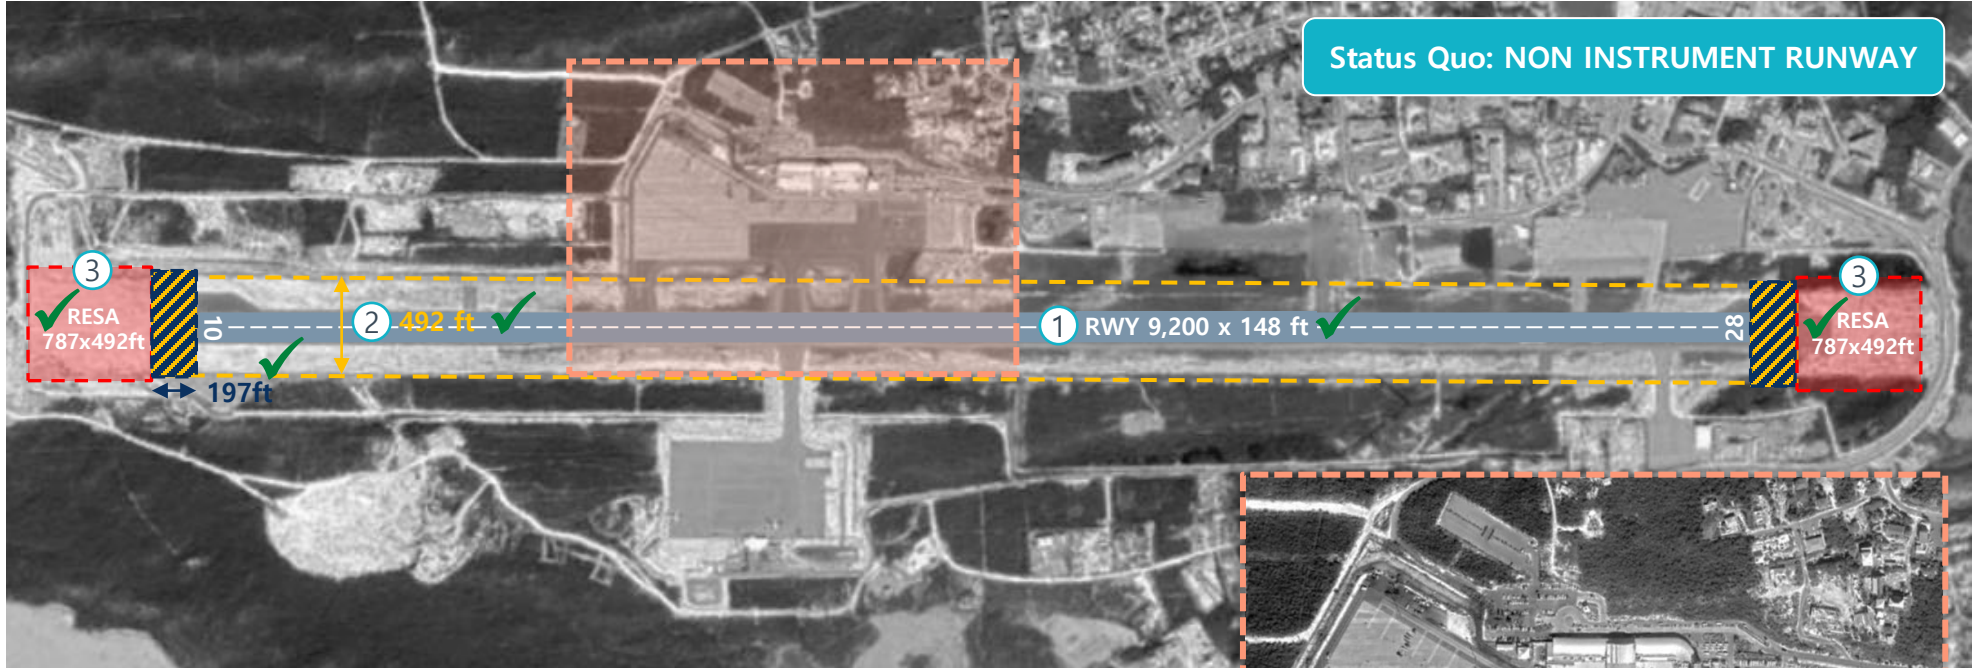

|                                |   |

Source: OACI Annex 14 8<sup>th</sup> Edition, AIP (May 2016), Google Earth and ALG analysis

Runway length (9,200m) allows aircraft to reach Europe with no penalization on pax load factor, without any constrain accordingly to the ATM forecast

### Aircraft Range from PLS (90% Payload)

### Caribbean Airports Runway Length Benchmark (ft)

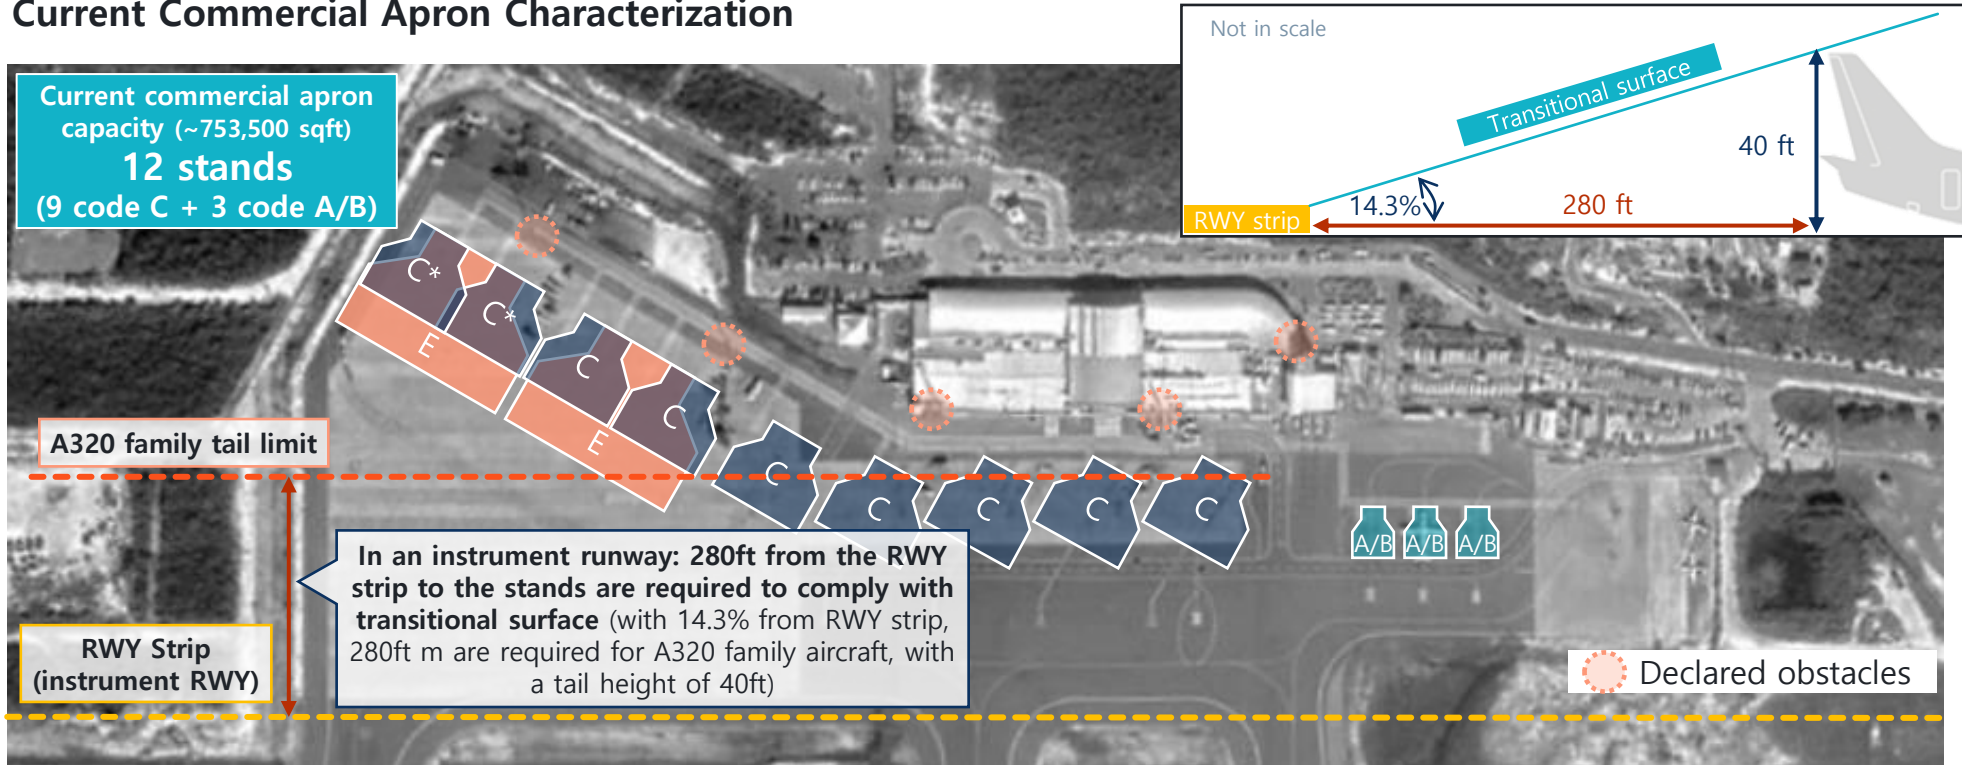

Source: Aircraft ACAPs, OAG, CAPA, ALG Analysis

If needed, the airport could expand its TODA ~650 meters by paving the RESA (THR 10) "starter extension", while keeping landing declared distances unaltered (for them to work as RESAs when landing) as some airports have done

PLS commercial apron has a capacity of 12 stands (3 code A/B + 9 C). Non-compliances would arise if the runway was classified as instrumental

### Current Commercial Apron Characterization

\*Distance between these stands is shorter than the recommended one for type C stands although it could still serve smaller Type C aircraft (e.g. ATR instead of A321)

- Providenciales airport has **9 (5+4) code C stands when the 2 code E stands are not in use** (each code E stand disables 2 code C stands). The airport's commercial apron has also **3 code A/B stands**
- As the runway is declared as non instrumental runway, the airfield is compliant with ICAO SARPs
- In case the runway was declared instrumental, the Code C stands in front of the terminal **would not comply with the transitional surface**, which is a typical issue in other airports of the region (*see next slide*)
- Obstacles are already declared as per the AIP amendment (floodlighting,...)

Other airports in the region do not comply with ICAO requirements for transitional surface but their operation is not affected by this infringement

### Benchmark of Caribbean Airports not compliant with Annex 14 Transitional Surface requirements

**Saint Kitts International Airport**  
*Saint Kitts and Nevis*  
0.5 Mseats 2019

- Code E aircraft operate at St. Kitts apron although it does not comply with transitional surface required for the A320 (Code C)
- 740ft from the RWY centerline are required to comply with the transitional surface (460ft strip + 280ft to clear A320 height)

**Santiago de Cuba International Airport**  
*Cuba*  
0.5 Mseats 2019

- Santiago de Cuba airport makes aircraft park parallel to the runway to prevent aircraft from penetrating the transitional surface to a larger extent
- Code D and E aircraft (B767 and A330) regularly operate at the airport

**Cartagena International Airport**  
*Colombia*  
6.4 Mseats 2019

- In 2005, the airport expanded its apron and included 4 additional stands that penetrate the transitional surface
- Code D and E aircraft (B767, A330 and A340) regularly operate at the airport

It is a common practice in the region to comply with transitional surface requirements in new infrastructure developments and warning about non-compliant current infrastructure in the AIP, thus not affecting airport operation

Source: ALG analysis

PLS airfield capacity is 7 ATM/h according to site visit inputs; but published schedules show higher peaks, which should be translated into delays

### Disconnect between airfield capacity and public schedules

**Declared Capacity**  
(site visit info)

**7 ATM/h**

**Demand peak**

**16 scheduled ATM/h  
+ 3 ATM/h FBO**

Peak day profile for ATM/h (Source: TCIA)

Peak day:  
Saturday 08/01/2022

- In 2022, PLS had **16 ATM/h scheduled in the peak day** (Saturday 8<sup>th</sup> January) plus 3 ATM/h of FBO. In 2019, this figure was even higher, with the peak day registering 18 ATM/h.
- The airport has a non instrument runway and **arrivals are separated ~15 min** as indicated in the site visits. With this separation, capacity can **difficulty increase above 7 ATM/h**.
  - Pending info on which Air navigation systems are and will be available in the airport
  - Despite site visit indicates 7 ATM/h, higher capacity could currently be in place during peaks, given that there are delays but they seem to be under reasonable limits. The differences between scheduled flights and runway capacity usually imply that a certain number of flight need to be delayed.

Source: OAG, Public information, ALG analysis

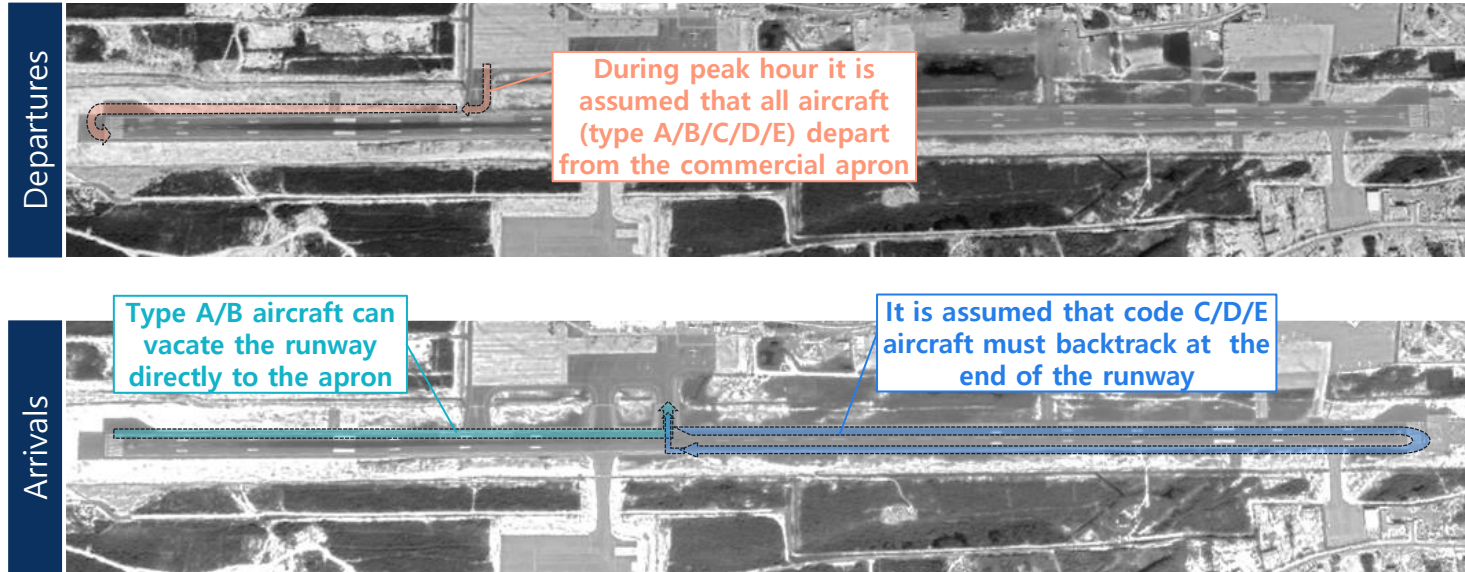

Even the airport personnel declared to have 7 ATM/h in the site visit, higher capacity is currently in place

The airport personnel declared that arrivals are separated 15 min (900 seconds), which causes a bottleneck between sequences of arrivals

### Departures and Arrivals Paths and Separation Times

### Assumptions

- Assumes that all code C/D/E aircraft are backtracking at the end of the runway after their landing, following ICAO procedures
- A separation time of 15 minutes is assumed, as per information received during the Site Visit
- Even though a 2,000 meters landing roll *could be* enough for most code C, it is not clear at this stage that this is the current procedure at PLS

*NOTE: Separation matrix times based on the results from the analysis*

Arrival → Arrival

| 1st aircraft | 2nd aircraft |      |      |
|--------------|--------------|------|------|
|              | A/B          | C    | D/E  |
| Type A/B     | ~900         | ~900 | ~900 |
| Type C       | ~900         | ~900 | ~900 |
| Type D/E     | ~900         | ~900 | ~900 |

Arrival → Departure

| 1st aircraft | 2nd aircraft |      |      |
|--------------|--------------|------|------|
|              | A/B          | C    | D/E  |
| Type A/B     | ~135         | ~135 | ~135 |
| Type C       | ~340         | ~340 | ~340 |
| Type D/E     | ~350         | ~350 | ~350 |

Departure → Arrival

| 1st aircraft | 2nd aircraft |      |      |
|--------------|--------------|------|------|
|              | A/B          | C    | D/E  |
| Type A/B     | ~900         | ~900 | ~900 |
| Type C       | ~900         | ~900 | ~900 |
| Type D/E     | ~900         | ~900 | ~900 |

Departure → Departure

| 1st aircraft | 2nd aircraft |      |      |
|--------------|--------------|------|------|
|              | A/B          | C    | D/E  |
| Type A/B     | ~120         | ~120 | ~120 |
| Type C       | ~120         | ~120 | ~120 |
| Type D/E     | ~120         | ~120 | ~120 |

Source: FAA, OACI, Site Visit, ALG analysis

Assuming that aircraft were separated 15min, the capacity would be 7-9 ATMs/h as declared by the airport personnel

### Analysis of Random Sequences of Operation and Resulting ATMs/h throughput

| Total ATMs/h: | 1       | 2       | 3       | 4       | 5       | 6       | 7       | 8       | 9       | 10      | 11      | 12      | 13      | 14      | 15      | 16      | 17      | 18      | 19      | 20    |

Illustrative

Random sequences of arrival & departures assuming a mix of 70% code C, 20% code A/B aircraft & 10% code D/E aircraft

Source: FAA, OACI, ALG analysis

Even the airport declared that arrivals are separated 15min and capacity is 7 ATM/h, it seems that a shorter separation is being used during peak times

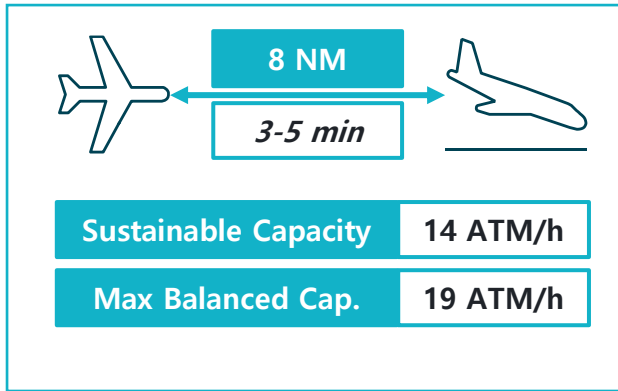

- The airport personnel declared that arrivals are separated 15 min (900 seconds), which implies a capacity of 7 ATM/h
- Despite site visit indicates 7 ATM/h, higher capacity could currently be in place during peaks, given that there are delays but they seem to be under reasonable limits
- Preliminary, the Consultant estimates that a separation of ~8 NM could be used during peak times to handle the demand of 16 scheduled ATM/h plus the additional FBO aircraft operating in the peak hour (+3 ATM/h)
- In Latin America and the Caribbean typical separations in approach phase are ~8 NM

Demand shows peaks of 16 scheduled ATM/h plus the FBO operations, so higher capacity than the one declared is currently in place

# Several infrastructure solutions have been analysed to assess the impact of implementing each one

## Current situation and summary of potential airfield capacity improvements

- First step would be the **construction of a turn pad** to facilitate backtracking without reaching the end of the runway, as similar Caribbean airports have applied
- The next step is to build a **parallel TWY connected to THR10**, which would reduce the time needed between departures
- Another option is to build a **parallel TWY for arrivals**, which would reduce the time between arrivals as aircraft could vacate the runway faster
- The last option is to build the **full parallel TWY**, which would allow to achieve the best performance

17-19 ATMs/h  
(+ 3 vs. 8 NM separation)

19-21 ATMs/h  
(+ 2 ATM/h compared to only turn pad)

20-22 ATMs/h  
(+ 3 ATM/h compared to only turn pad)

26-28 ATMs/h  
(+ 9 ATM/h compared to only turn pad)

A quick-win after reducing separation between approaches is the construction of a turn pad, common in Caribbean airports. Capacity increases to 17-19 ATM/h

### New Turn Pad at 6,560 ft for Arrivals

Runway Occupancy Time: 250s → 150s

Other airports in the region already have a turn pad in order to reduce runway occupancy time in arrivals

Source: Google Earth, ALG Analysis

The new turn pad would normalize backtracking of aircraft before reaching the end of the runway, a practice already performed by some aircraft without complying with ICAO guidelines (only allowed if there is a turn pad enabled)

The development of a TWY connecting the apron and THR 10 would have a minimal impact, increasing airfield capacity to 19-21 ATMs/h (+2 ATMs/h)

### New Partial Parallel TWY for Departures

Time from apron to THR: 90s → <10s

The **construction of a TWY** connecting the commercial apron and THR 10 **would reduce the time needed for departures** as aircraft would not need to taxi in the runway and use the turn pad to take-off

#### Arrival → Departure

| 1st aircraft | 2nd aircraft  |   |     |
|--------------|---------------|---|-----|
|              | A/B           | C | D/E |
| Type A/B     | ~50s (-85s)   |   |     |
| Type C       | ~150s (-190s) |   |     |
| Type D/E     | ~190s (-160s) |   |     |

#### Departure → Departure

| 1st aircraft | 2nd aircraft |   |     |
|--------------|--------------|---|-----|
|              | A/B          | C | D/E |
| Type A/B     | ~60s (-60s)  |   |     |
| Type C       | ~90s (-30s)  |   |     |
| Type D/E     | ~120s        |   |     |

### Analysis: 8 NM between ARR, 20% Type A/B, 70% Type C & 10% Type D/E

Source: FAA, OACI, ALG analysis

The development of a TWY at 6,560 ft from THR10 (for arrivals) would increase airfield maximum capacity up to 20-23 ATMs/h (+3 ATMs/h)

New Partial Parallel TWY for Arrivals

Runway Occupancy Time: 250s → ~66s

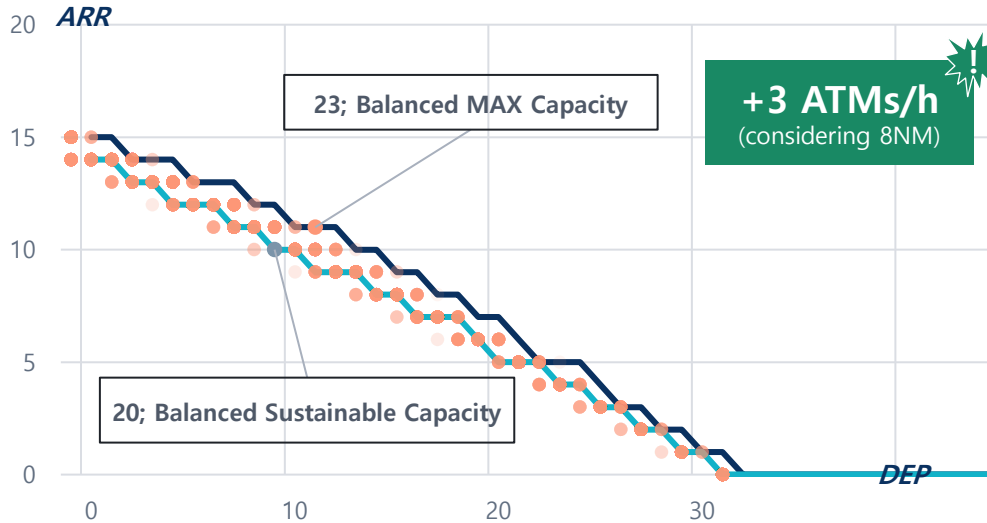

The **construction of a TWY for arrivals** would reduce the time needed for arrivals given that **aircraft would not need to use the runway to backtrack and taxi** to the apron, vacating the RWY earlier and reducing ROT

| Arrival → Arrival        |                          |         |         | Arrival → Departure      |                          |   |     |
|--------------------------|--------------------------|---------|---------|--------------------------|--------------------------|---|-----|

Analysis: 8 NM between ARR, 20% Type A/B, 70% Type C & 10% Type D/E

Source: FAA, OACI, ALG analysis

The maximum capacity would be achieved developing a full TWY, which would increase capacity up to 26-28 ATMs/h

### New Full Parallel TWY for Departures and Arrivals

Arrival → Arrival

| 1st aircraft | 2nd aircraft |               |               |
|--------------|--------------|---------------|---------------|
|              | A/B          | C             | D/E           |
| Type A/B     | ~230s        | ~153s (-250s) | ~138s (-260s) |
| Type C       | (-45s)       | ~191s (-250s) |               |
| Type D/E     |              |               | ~173s (-260s) |

Arrival → Departure

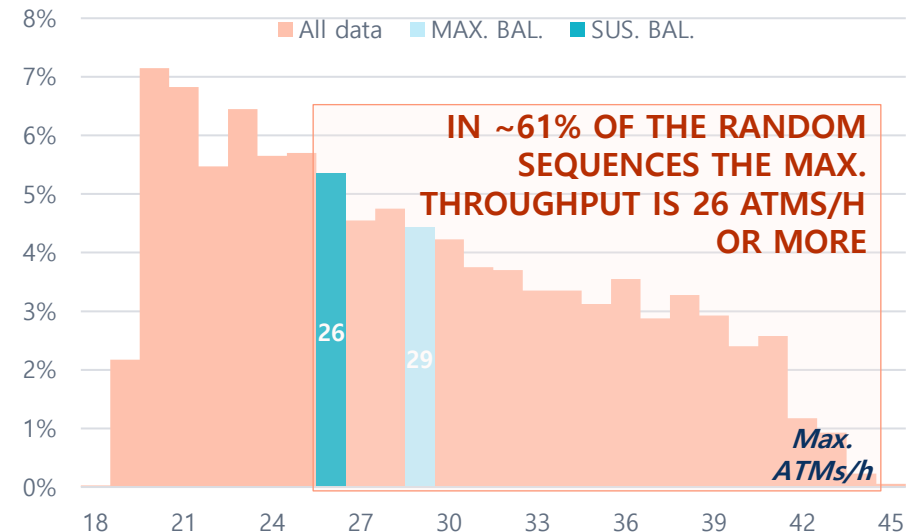

| 1st aircraft | 2nd aircraft  |   |     |
|--------------|---------------|---|-----|
|              | A/B           | C | D/E |
| Type A/B     | ~44s (-90s)   |   |     |
| Type C       | ~70s (-270s)  |   |     |
| Type D/E     | ~100s (-250s) |   |     |

Departure → Departure

| 1st aircraft | 2nd aircraft |      |     |
|--------------|--------------|------|-----|
|              | A/B          | C    | D/E |
| Type A/B     | ~60s (-60s)  |      |     |
| Type C       | ~90s (-30s)  |      |     |
| Type D/E     | ~120s        | ~90s |     |

### Analysis: 8 NM between ARR, 20% Type A/B, 70% Type C & 10% Type D/E

Source: FAA, OACI, ALG analysis

As a quick win, PLS should construct a turn pad and restrict FBO in the peak hour; the parallel taxiway should be fully operational in 2028

### Capacity-Demand Analysis – Airfield

Source: OAG, ALG Analysis

#### Current situation 2022

- PLS handles 19 ATM/h in the peak hour: 16 scheduled ATM/h (commercial traffic) plus 3 ATM/h of FBO aircraft
- Current capacity estimated to be ~14 ATM/h (with 8 NM aircraft separation in approach phase)

#### Quick wins in PLS:

- Restrict FBO traffic in the peak hour
- Construct a turn pad to increase capacity to 17 ATM/h

#### Short/mid term

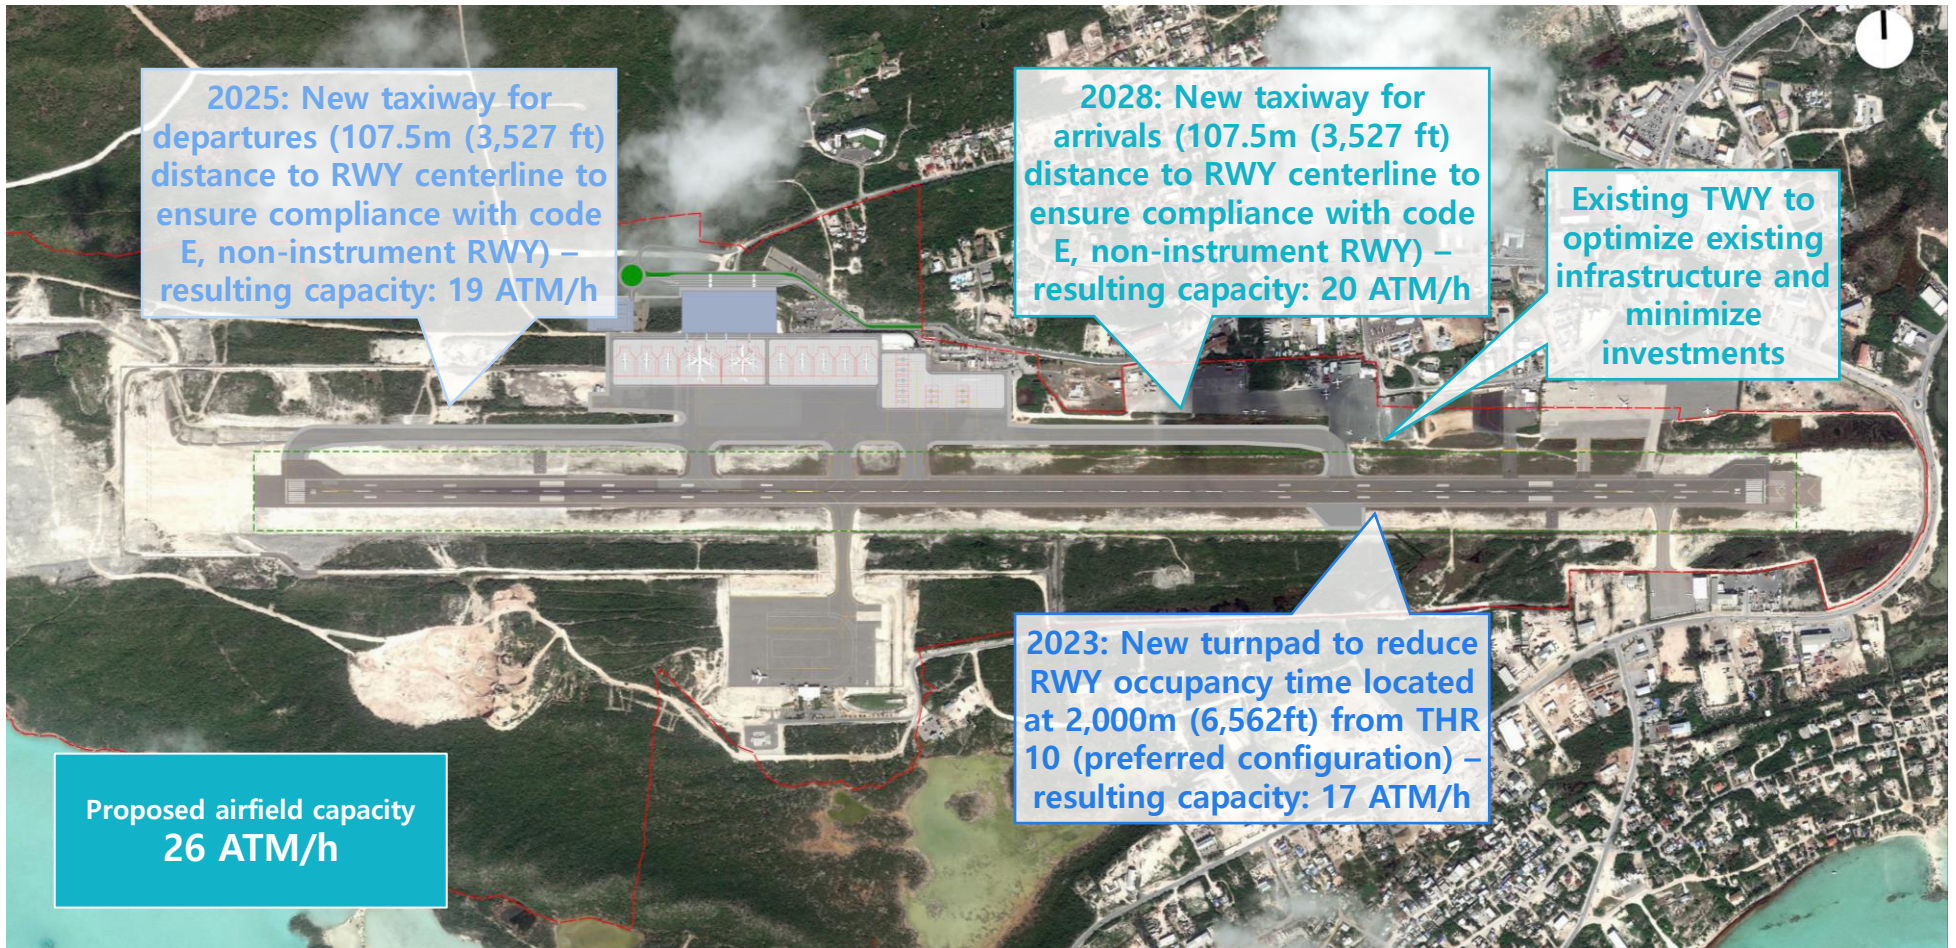

- Construct the taxiway for departures (required in 2025)
- Construct the taxiway for arrivals (required in 2028)
- With this parallel taxiway the airfield can handle the demand in the long term
- FBO could restart operating in the peak hour once the parallel taxiway is operational

The current ATMs/h profile of PLS, concentrating operation activity in a few daily hours as usual in Caribbean airports, requires early infrastructure development despite having relatively low volume of annual ATMs

Three phases have been proposed to increase airfield capacity: a new turnpad (2023), the TWY for departures (2025) and the TWY for arrivals (2028)

### Airfield proposed development

Source: ALG analysis

The development solution for PLS airfield is in line with the existing infrastructure of other Caribbean airports with similar operation profile (1/2)

### Caribbean Airports with a Full Parallel Taxiway

Nasau (NAS) 3.90 Mpax (2019)

Barbados (BGI) 2.3 Mpax (2019)

Bermuda (BDA) 0.93 Mpax\* (2019)

Curaçao (CUR) 1.23 Mpax\*(2019)

The development solution for PLS airfield is in line with the existing infrastructure of other Caribbean airports with similar operation profile (2/2)

### Caribbean Airports with a Partial Parallel Taxiway + Turn Pads

PLS commercial apron has capacity for up to 12 stands (3 code A/B + 9 code C), which is not enough to accommodate existing demand (2022)

### Apron current capacity

### Stands demand – Design day 2022

- ! DOM and INT peaks are independent considering that stands are not shared
- ! Current peak stand demand shows 11 INT Code C aircraft which surpasses capacity but some of the aircraft overlap for less than 10 min

Source: Google Earth, TCAA AIP, OAG, ALG analysis

The capacity-demand analysis shows that current apron is not enough to accommodate the short-term demand and thus expansions are envisaged

### Apron – Capacity-demand analysis

#### Code C Stands

#### Code B Stands

The projection of stand demand shows a substantial increase in DOM stands (9 DOM +12 INT) given the annual traffic increases expected in this segment

Two construction phases have been proposed to increase the apron capacity: quick wins to provide +3C & +4B and short/mid term in line with the new PTB

### QUICK WINS

Reconfiguration of existing DOM apron and minor expansion of INT apron to the West

- Reconfiguration of the current domestic stands to increase capacity to up 7 code B stands
- Expansion of existing international commercial apron to the west to provide 3 additional code C stands
  - No reconfiguration works envisaged at existing international commercial stands

### SHORT/MID TERM

Reconfiguration and expansion of existing DOM apron and reconfiguration and expansion of INT apron to the North

- Reconfiguration and expansion of the domestic stands to increase capacity to up 9 code B stands
- Reconfiguration and expansion of existing international commercial apron to the west to provide 12 code C stands with an inner taxiway compliant with the new parallel taxiway

# Quick wins: reconfiguration of DOM stands to increase capacity (up to 7 code B stands) and expansion of INT stands (+3 code C stands)

## Commercial apron proposed development – Phase I

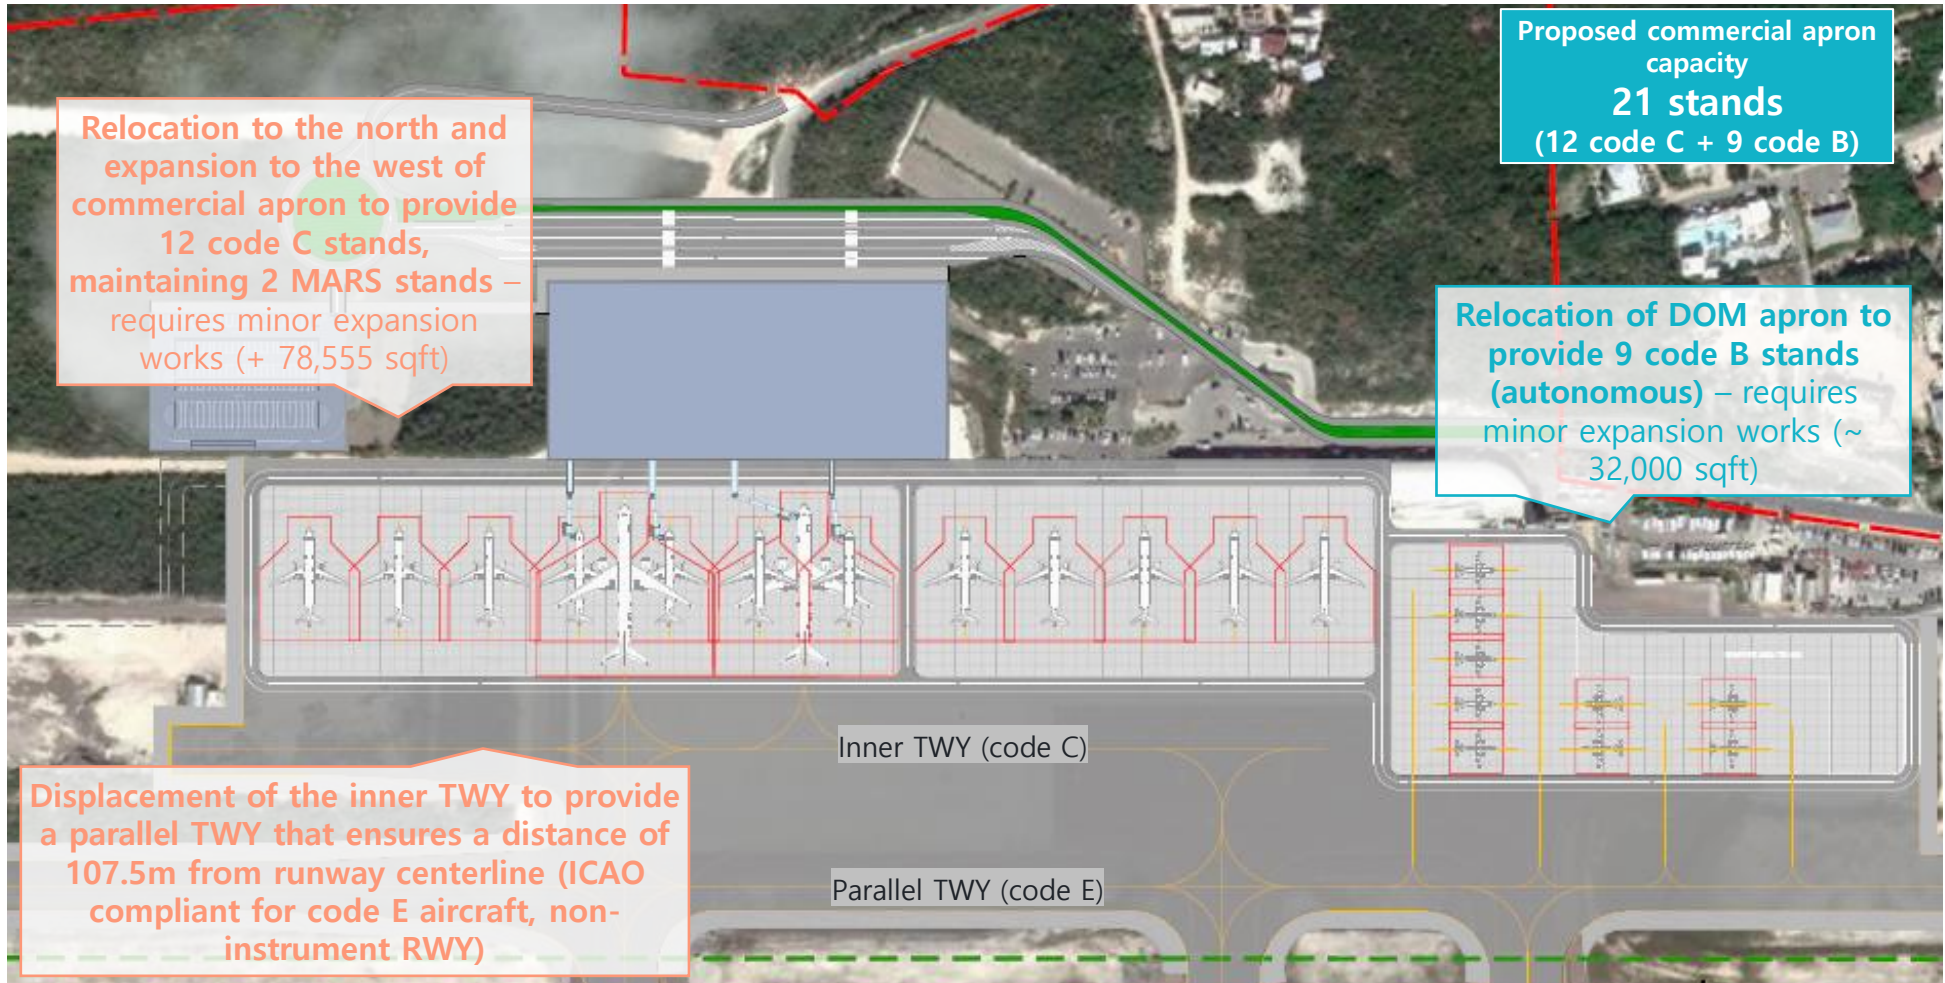

Source: ALG analysis

Short/mid term: expansion of DOM and INT stands to the northwest to increase capacity and provide a parallel taxiway

### Commercial apron proposed development – Phase II

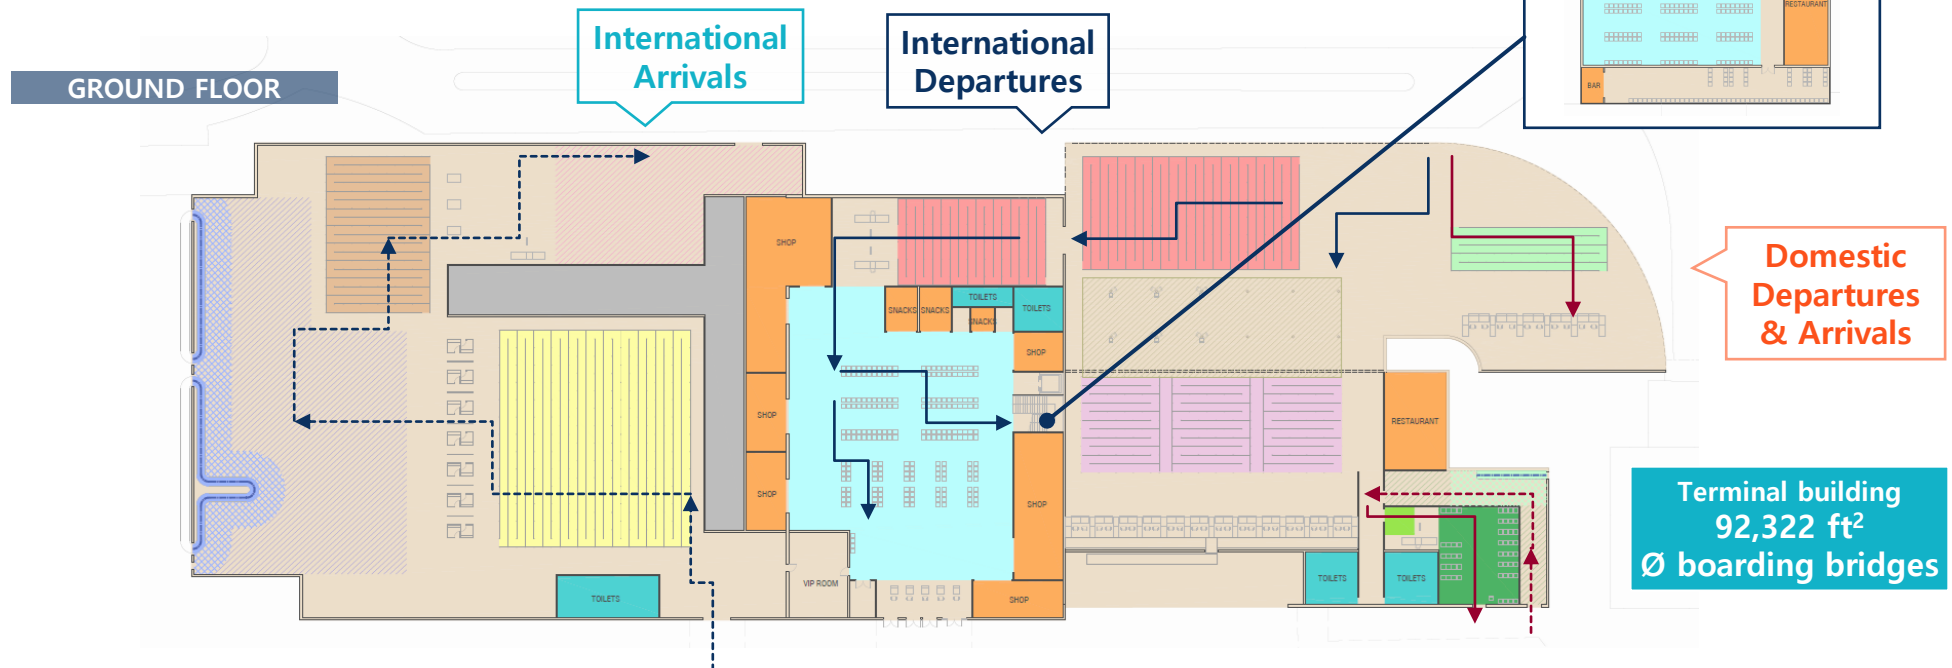

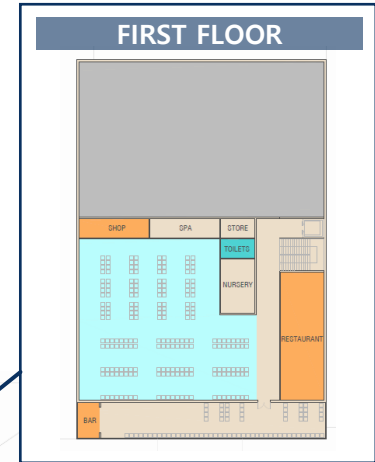

Source: ALG analysis

Providenciales terminal building has an area of 92,322 ft<sup>2</sup>, most of it devoted to international flights; the airport shows saturation in some subsystems

### Terminal Overview and Passenger Flows

Source: Site Visit, ALG analysis

Based on international benchmarks, the expansion of the terminal building will be needed to upgrade the level of service as traffic grows

### Terminal Building Area vs. Passenger Traffic Benchmark (2019)

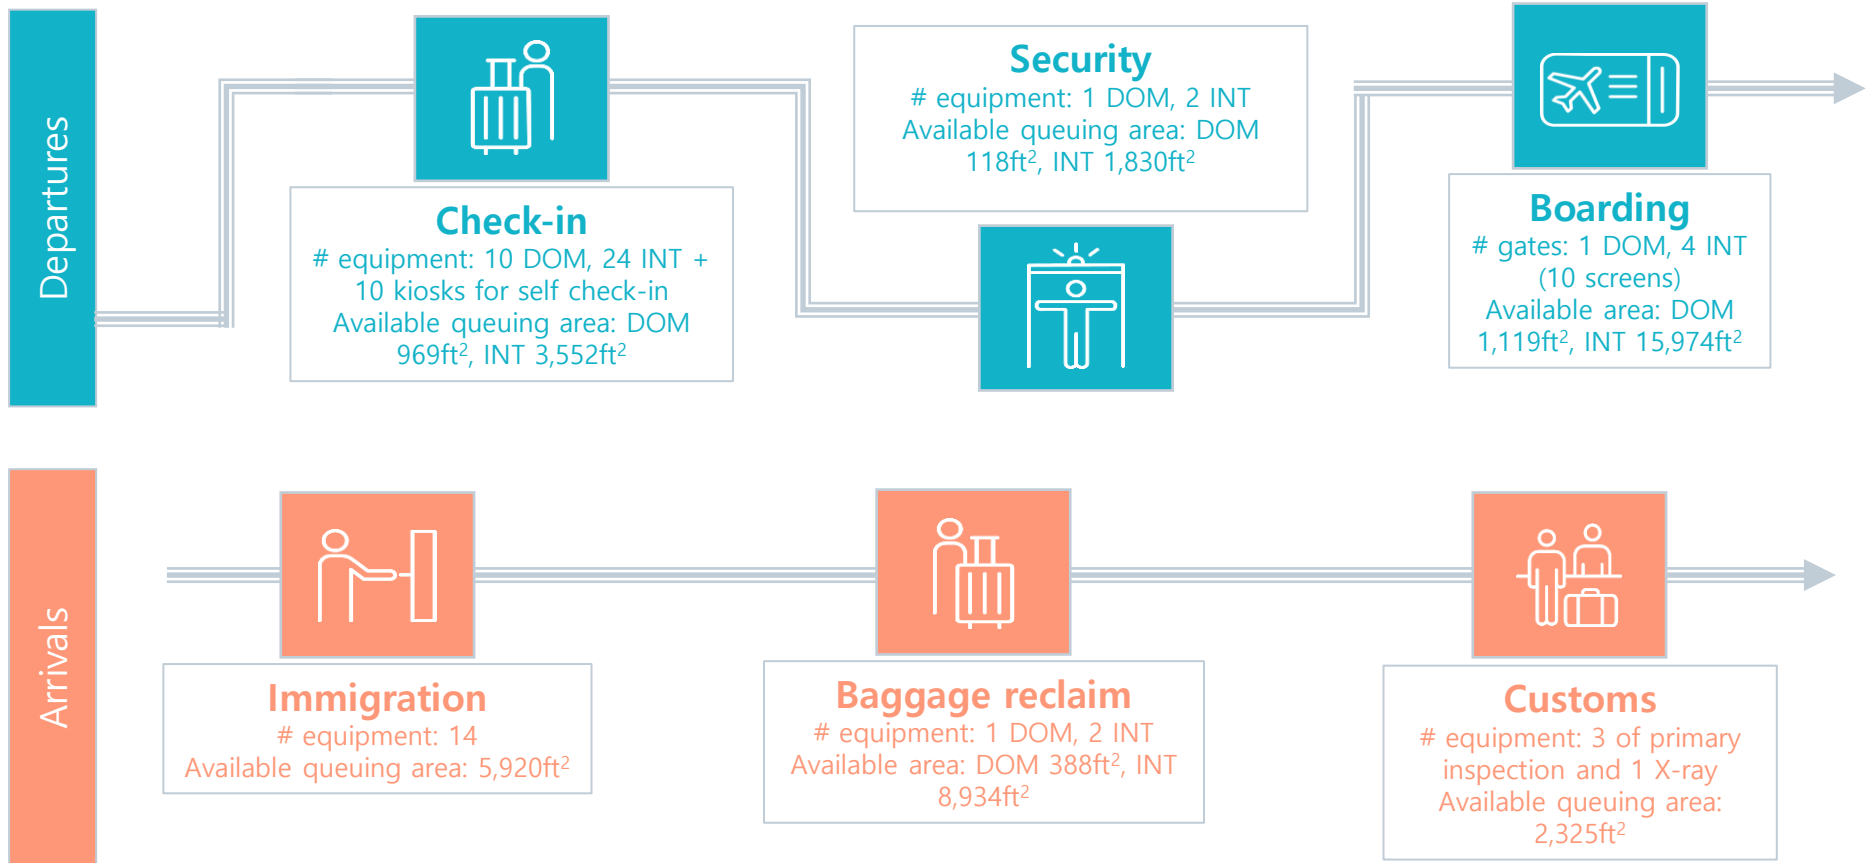

Sources: Satellite images, airport websites, FlightGlobal

Initial analysis suggest that PLS may require a ~215,000 sqft terminal building in the long term to handle 2 Mpax

The PTB capacity has been assessed following IATA ADRM 11<sup>th</sup> Edition methodology per passenger processing facility assuming an optimum LoS

**Inputs for passenger processing facilities requirements estimation (existing capacity)**

Sources: Public Information, VDR, IATA, ALG Analysis

The analysis is adapted to airport particularities and national regulations considering forecasted design parameters and industry standard processing times (refer to next slides)

# The C-D analysis is based on airport particularities, industry standard processing times, and an optimum Level of Service (IATA)

## Inputs for passenger processing facilities requirements estimation (1/6)

### Input parameters for IATA analysis:

- ? Processing time: 180s in traditional check-in, 120s in self check-in
- ? Proportion of business passengers: 7% of the total PHPs
- ? % of people using check-in: 100%
- ✓ Space per pax: 14 ft<sup>2</sup>
- ✓ Max queuing time: 20min economy, 5min business

✓ **IATA LoS Optimum**

Source: Public information, VDR, IATA and ALG Analysis

# The C-D analysis is based on airport particularities, industry standard processing times, and an optimum Level of Service (IATA)

## Inputs for passenger processing facilities requirements estimation (2/6)

**RFI pending**

**Input parameters for IATA analysis:**

- ? Processing time: DOM 20s
- ? Processing time: INT 30s
- ✓ Space per pax: 10.8 ft<sup>2</sup>
- ✓ Max queuing time: 10min

**✓ IATA LoS Optimum**

Source: Public information, VDR, IATA and ALG Analysis

# The C-D analysis is based on airport particularities, industry standard processing times, and an optimum Level of Service (IATA)

## Inputs for passenger processing facilities requirements estimation (3/6)

**RFI pending**

### Input parameters for IATA analysis:

- ? Turnaround time: 1.7 h
- ? Average pax/ATM: INT ~233, DOM ~35
- ✓ Seat ratio: 50%
- ✓ Space per pax: 12.9 ft<sup>2</sup> per standing person and 19.4 ft<sup>2</sup> per seated person

**✓ IATA LoS Optimum**

The C-D analysis is based on airport particularities, industry standard processing times, and an optimum Level of Service (IATA)

Inputs for passenger processing facilities requirements estimation (4/6)

**RFI pending**

**Input parameters for IATA analysis:**

- ? Processing time per pax: 90s (gradually reduced up to 60s to take into account the new automated passport control booths that optimize processing time)
- ✓ Max queuing time: 10min
- ✓ Space/pax: 10.8 ft<sup>2</sup>

✓ **IATA LoS Optimum**

Source: Public information, VDR, IATA and ALG Analysis

The C-D analysis is based on airport particularities, industry standard processing times, and an optimum Level of Service (IATA)

Inputs for passenger processing facilities requirements estimation (5/6)

**RFI pending**

**Input parameters for IATA analysis:**

- ? Average claim device occupancy time: DOM 15 min, INT 25 min
- ? Claim frontage per pax: 1.3 ft
- ✓ Space per pax: 16.2 ft<sup>2</sup>

**✓ IATA LoS Optimum**

The C-D analysis is based on airport particularities, industry standard processing times, and an optimum Level of Service (IATA)

Inputs for passenger processing facilities requirements estimation (6/6)

**RFI pending**

**Input parameters for IATA analysis:**

- ? Ratio of pax inspected: 7%
- ? Processing time: 20s for primary inspection and 20s at X-ray facility
- ✓ Space per pax: 14 ft<sup>2</sup>
- ✓ Max queuing time: 5min for primary inspection and 5min for X-ray

✓ **IATA LoS Optimum**

Source: Public information, VDR, IATA and ALG Analysis

The analysis shows major congestion in the terminal building already with the current condition and 1.2 Mpax, especially for INT subsystems' equipment 

### Results for the IATA analysis of terminal capacity – Equipment Requirements

|                                 | <b>Customs - X-ray</b>                  | <b>1</b>    | <b>100%</b> | <b>100%</b> | <b>100%</b> | <b>100%</b> | <b>100%</b> |
| Required equipment              |   | 1           | 1           | 1           | 1           | 1           |             |

The number of check-in counters is not enough to accommodate the existing demand 

INT security control is saturated causing long queuing areas that are allocated in front of the check-in area requiring +3 additional lanes 

The terminal has 4 INT boarding gates, which are not enough to accommodate the existing demand (although there are 10 screens) 

The C-D analysis assumes the reduction of the average passenger processing time as a result of the new automated passport control booths that are planned at the airport 

INT baggage claim belts are not enough to accommodate the existing demand (2022). The belt's length does also not provide an adequate LoS 

In terms of areas, congestion is more evident in DOM areas, while the INT boarding area and baggage claim area is also congested

### Results for the IATA analysis of terminal capacity – Area Requirements

INT queuing area for security screening would be enough if there were 5 lanes available

DOM queuing area for security screening is not enough to accommodate the existing demand

INT boarding area is also congested showing the need of increasing the facility in the short-term

DOM boarding area shows significant congestion level requiring to double existing capacity to provide an adequate LoS

INT baggage claim area shows significant congestion, i.e. existing area is not enough to provide an adequate LoS

Source: ALG Analysis

95% No congestion 100% Full capacity 115% Congestion 140% Saturation

Given the current saturation of the terminal, two development phases have been considered to cope with the expected demand without constrains

### On-going projects

In PLS

- Several on-going projects in the airport (South area)
  - A new control tower
  - ARFF facilities are being relocated
  - Maintenance & administration facilities
- Other: e-Gates, canopy projects

### QUICK WINS

Refurbishment of the current terminal building

- Reconfiguration of the current terminal to increase the level of service
  - Expand the international pax area using domestic area and move domestic flows to current ARFF area
  - Expand international lounge moving the airlines to a temporary building

### SHORT/MID TERM

Construction of a new passenger terminal building

- A new terminal building is the preferred option after the site visit and consultation talks carried out
- Estimated area of 20,000 – 25,000 sqm (to be commissioned by 2028)
- Architecture to take into account the local atmosphere (Caribbean look & feel) and the high-class product offering

# Quick wins: relocation of DOM facilities to ARFF area (17,200 ft<sup>2</sup>), reconfiguration and expansion of existing PTB to the west increasing ~9,500 ft<sup>2</sup>

## Terminal quick wins & passenger flows

  Area of expansion 
 ➔ DOM Departure 
 ➔ DOM Arrival 
 ➔ INT Departure 
 ➔ INT Arrival

### FIRST FLOOR

*Capacity to accommodate demand until 2028*

**Total area of 119,000 ft<sup>2</sup>**

including 21,500 ft<sup>2</sup> INT boarding area

22,600 ft<sup>2</sup> commercial area

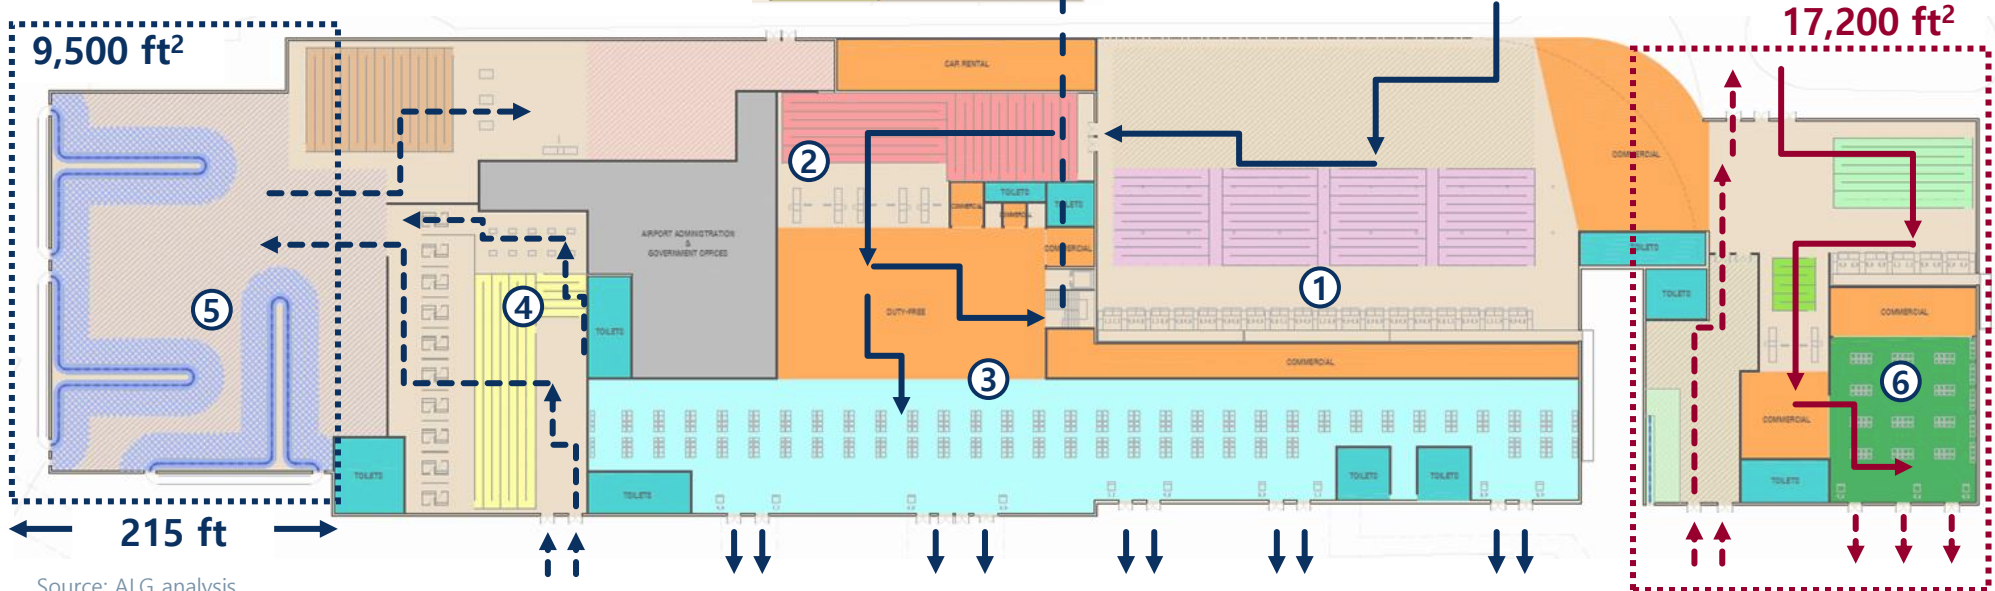

1,600 ft<sup>2</sup> new VIP lounge

### GROUND FLOOR

### Expansion y reconfiguration of existing terminal

1. Relocation and expansion of INT check-in counters including free space for make-up area
2. Expansion of security control with three additional lanes
3. Increased INT boarding area including walk-through duty free, additional boarding gates, relocation of VIP lounge, provide a food court area and increase seating area
4. Reconfiguration of immigration including the provision of automated passport control booths
5. Expansion of INT baggage belts length and new belt
6. Relocation and expansion of DOM facilities

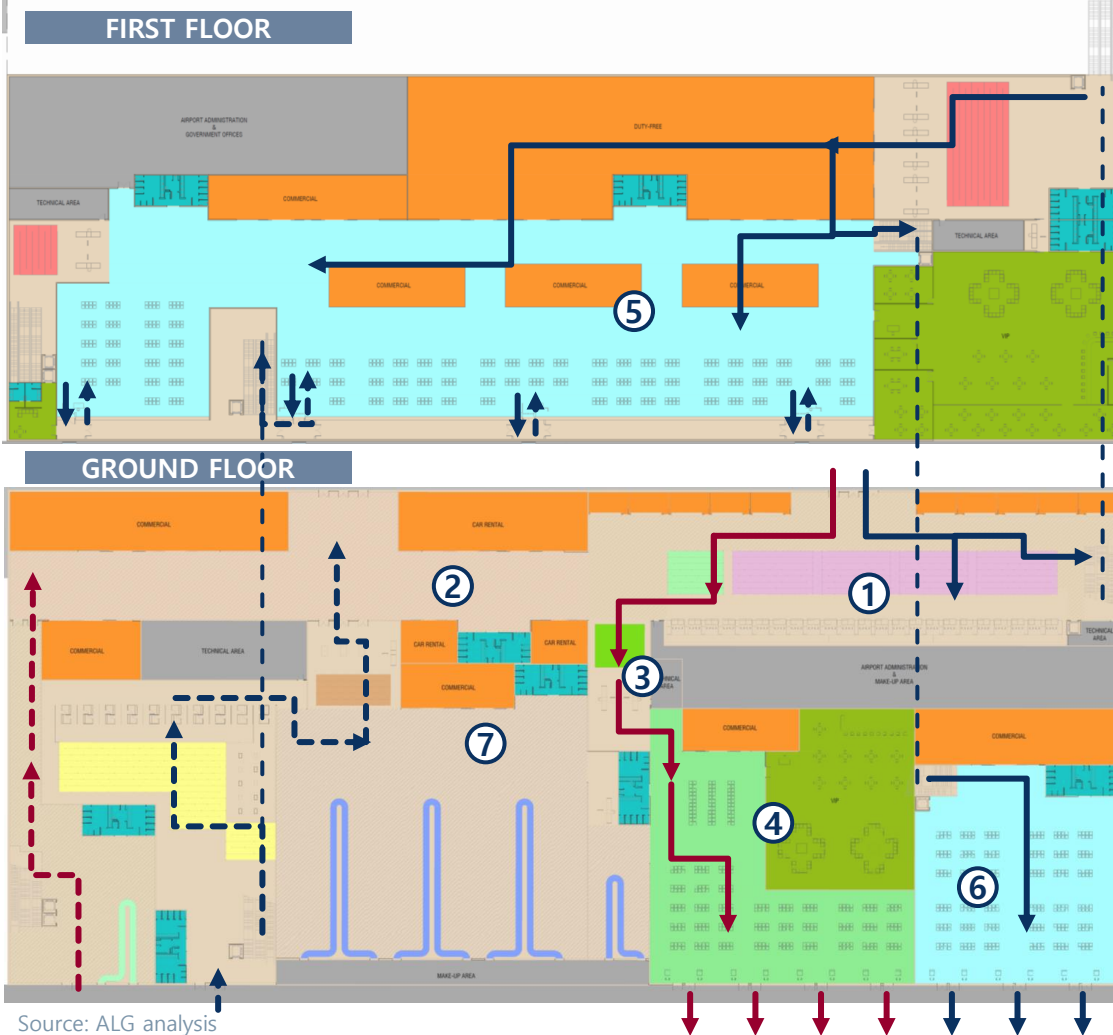

Source: ALG analysis

# New terminal: two-floor building of ~270,000 ft<sup>2</sup> including DOM and INT facilities with an overall capacity of approx. 2.5 Mpax

## New terminal & passenger flows

Source: ALG analysis

→ DOM Departure    - - -> DOM Arrival    → INT Departure    - - -> INT Arrival

### New terminal building

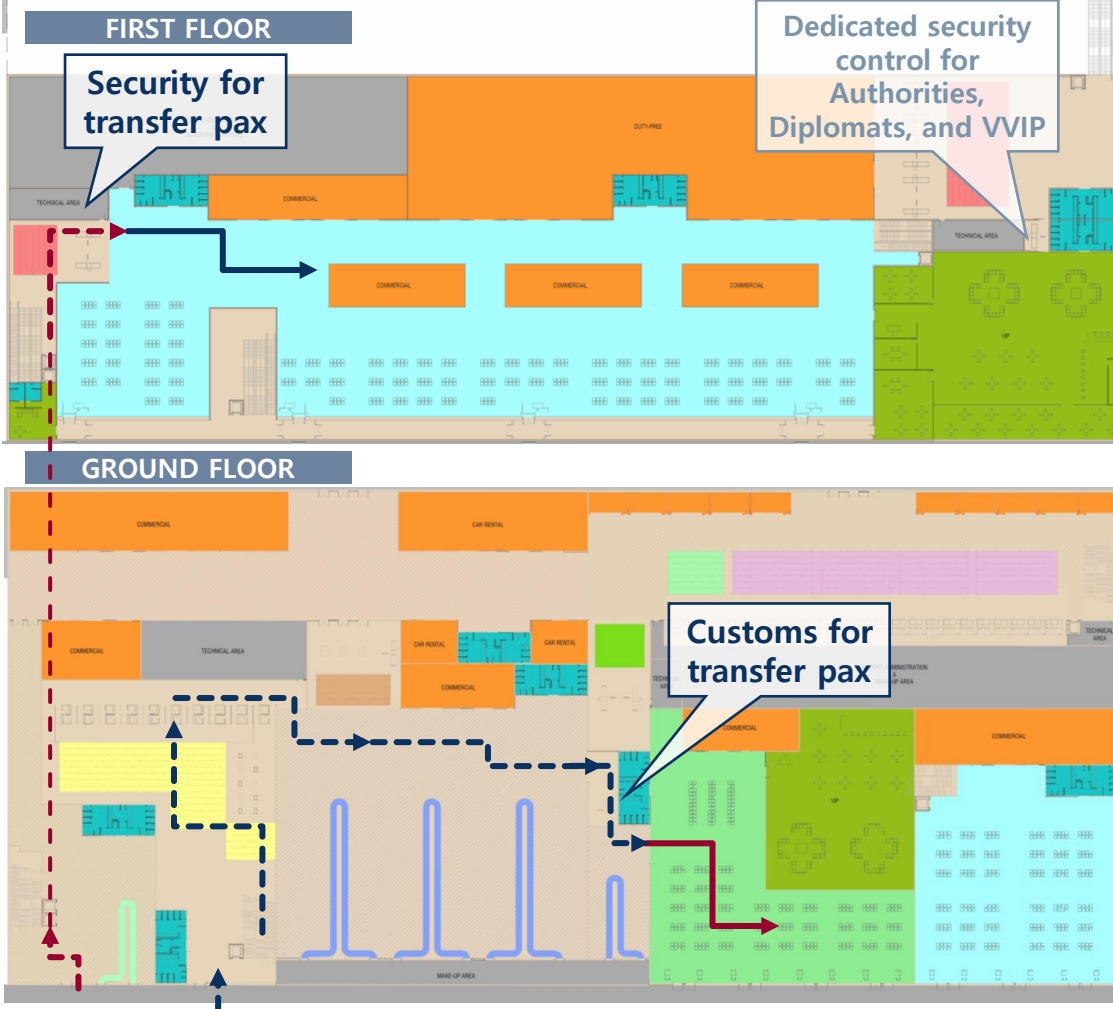

1. Common check-in (DOM&INT) including departures hall with additional space for airlines, technical areas and make-up area
2. Common arrivals and departures hall with significant commercial areas to allocate car rental facilities as well as restaurants and other retail areas
3. Domestic security control including two lanes and additional queuing area
4. Domestic boarding area with a dedicated VIP area to improve the passenger's experience as well as increase non-aeronautical revenues of the airport
5. International departing facilities located mainly on first floor including security control and boarding area with walk-through duty-free, other commercial areas, and an exclusive VIP lounge. Four boarding bridges are also considered to improve the passenger's experience
6. Remote international boarding area with commercial facilities on the ground floor to provide additional boarding gates and holdroom area
7. International arrivals facilities located at ground floor including automated passport control, long baggage belts, and customs

**Resulting ratio**    ~122,000 sqft/Mpax

Specific facilities for transfer passengers (DOM-INT and INT-DOM) are proposed in the new terminal given the importance thereof

### New terminal – Transfer passengers

→ DOM Departure    - - -> DOM Arrival    → INT Departure    - - -> INT Arrival

### DOM – INT

- DOM passengers with connecting flights will have the possibility of directly entering the INT boarding lounge after passing through a specific security control located on the first floor

### INT – DOM

- INT passengers with connecting flights will have the possibility of directly entering the DOM boarding lounge after passing through immigration and collecting their baggage
- A specific customs and baggage belt for transfer passengers is proposed in order to ensure the security requirements

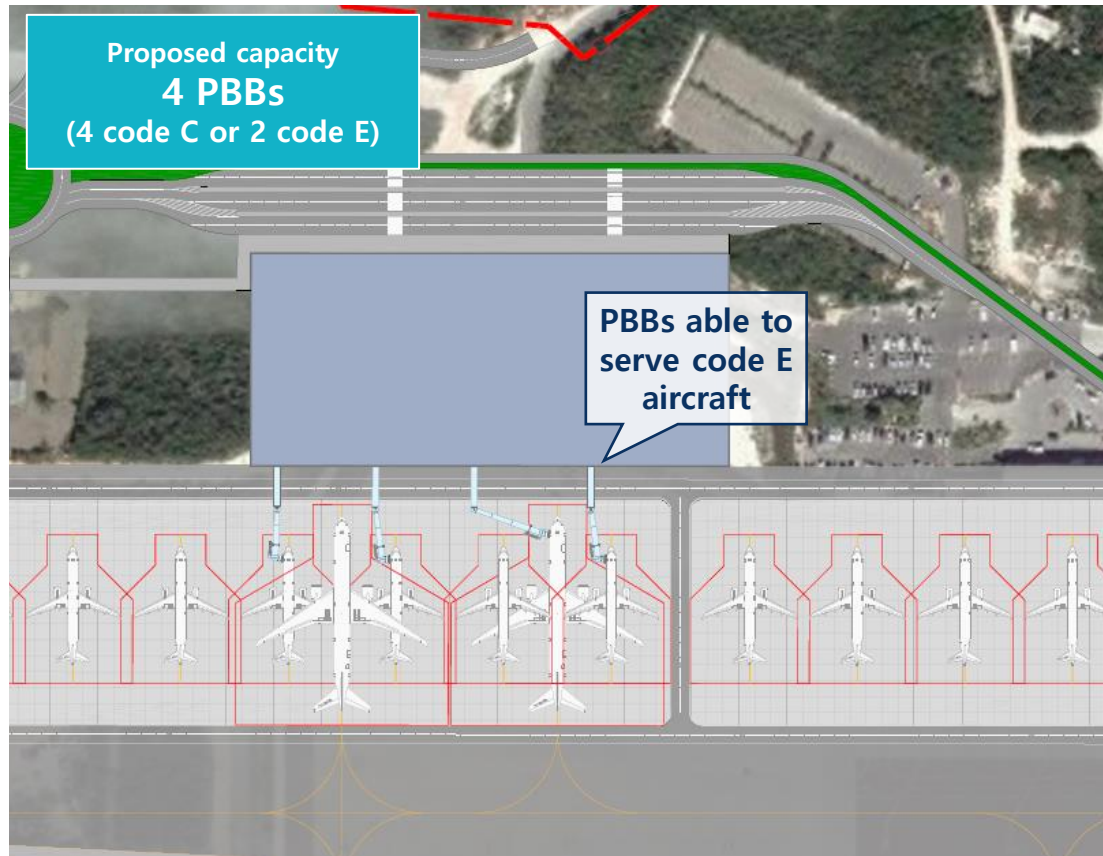

Source: ALG analysis

The new terminal building includes four boarding bridges to serve up to four code C aircraft simultaneously and improve the passenger experience

### Proposed passenger boarding bridges at PLS

PBBs subject to architecture design

Source: ALG Analysis

| Mpax/PBB estimation                         |             |
|---|-------------|
| Parameter                                   | Value       |
| Turnaround time ( <i>min</i> )              | 96          |
| Buffer between turnarounds ( <i>min</i> )   | 5           |
| Operational hours ( <i>h</i> )              | 8           |
| Max daily ATM/PBB ( <i>2 ATM/rotation</i> ) | 4.8         |
| Pax/ATM                                     | 95          |
| Max daily kpax/PBB                          | 0.9         |
| Max annual Mpax/PBB                         | 0.33        |
| Safety factor                               | 20%         |
| <b>Annual Mpax/PBB</b>                      | <b>0.26</b> |
| Annual INT pax 2053                         | 1.72        |
| % of pax served by PBB                      | 60%         |
| <b>Required PBBs</b>                        | <b>3.92</b> |

With the proposed boarding bridges 60% of 2053 INT demand at PLS would be covered (~1Mpax of 1.7 Mpax)

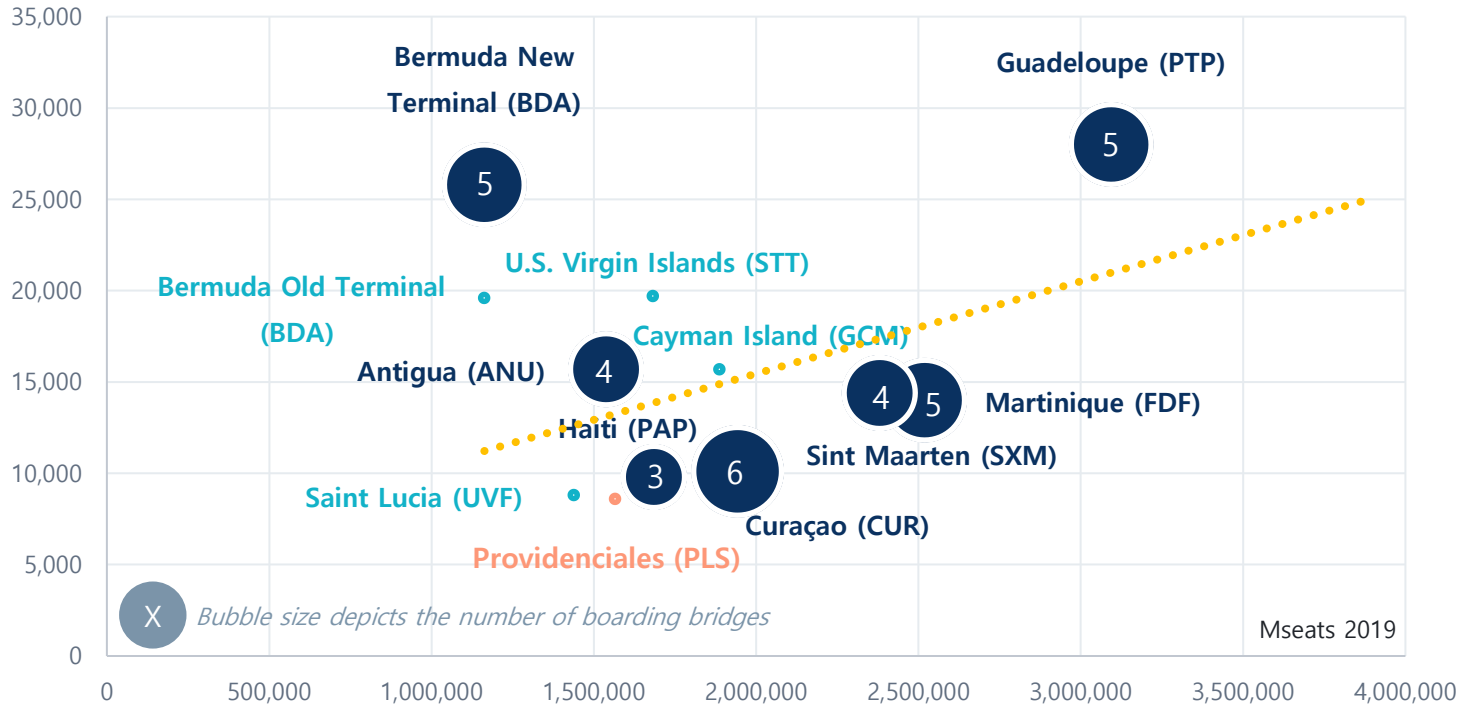

The proposed boarding bridges are aligned with similar airports located in “high yield” destinations in the Caribbean which have 4-6 PBBs

### Caribbean Airports Terminal Dimensions Benchmark

Terminal Surface (sqm)

Source: OAG, ALG analysis

The airport has a single road access that connects the airport with the town of Providenciales

### Road access and curbside current situation

- The main access to the airport is via the **Airport Road, a two lane paved road** (one lane each direction) that suits regular vehicles
- Other secondary roads serve the airport connecting the public parking and FBOs' buildings

Source: Google Earth, ALG analysis

The demand generated by the airport is composed of the number of movements associated with passengers, visitors and employees (1/2)

### Traffic characterization and operating parameters for vehicle demand estimation

Modal split based on the resulting average of the survey conducted by TCIAA during three consecutive days (30<sup>th</sup> July 2022, 31<sup>st</sup> July 2022, and 1<sup>st</sup> August 2022) at the exact time each day

Source: TCIAA Curbside traffic survey (July 2022), ALG Analysis

The surface access capacity-demand analysis has been developed based on the survey information gathered by TCIAA

The demand generated by the airport is composed of the number of movements associated with passengers, visitors and employees (2/2)

**Traffic characterization and operating parameters for vehicle demand estimation**

**RFI pending**

Assumptions subject to validation

|                   | User       | Pax / Vehicle | Dwell Time | Required Length* |
|-------------------|------------|---------------|------------|------------------|
| <b>Curbside</b>   | Ride/Own   | 2.5 pax/v     | 3 min      | 23 ft/space      |

Source: TCIAA Curbside traffic survey (July 2022), ALG analysis

- Passenger flow is based on peak hour
- An increase in the employee's demand for airport access is considered to account for the increase in traffic and commercial/real estate activities
- For employees using their own vehicle, it is considered that their arrival is distributed generating a 40% coincidence with the peak of passengers
- The fact that the access road is mainly for the exclusive use of the airport means that the additional demand for vehicles outside the airport is reduced (assumed a hypothesis of 2.5% over the peak of passengers and employees)
- Further studies should evaluate the simultaneous (ARR+DEP) peaks and the effect of a recirculation rate for vehicles that can drop off a pax and pick other up in sequence

# The airport access road is expected to show congestion during peak times in the long term

## Access road capacity-demand analysis

Note: The flows have been adjusted with a security factor of 0.90 for heavy vehicles and 0.90 for light vehicles for non-regular users of the road

– Preliminary results show that a **widening would serve to alleviate congestion** in the forecasted period, although **additional actions (outside the scope of the concession) may be required** at the end of the forecasted period

– There are measures that could potentially improve the forecasted traffic volumes

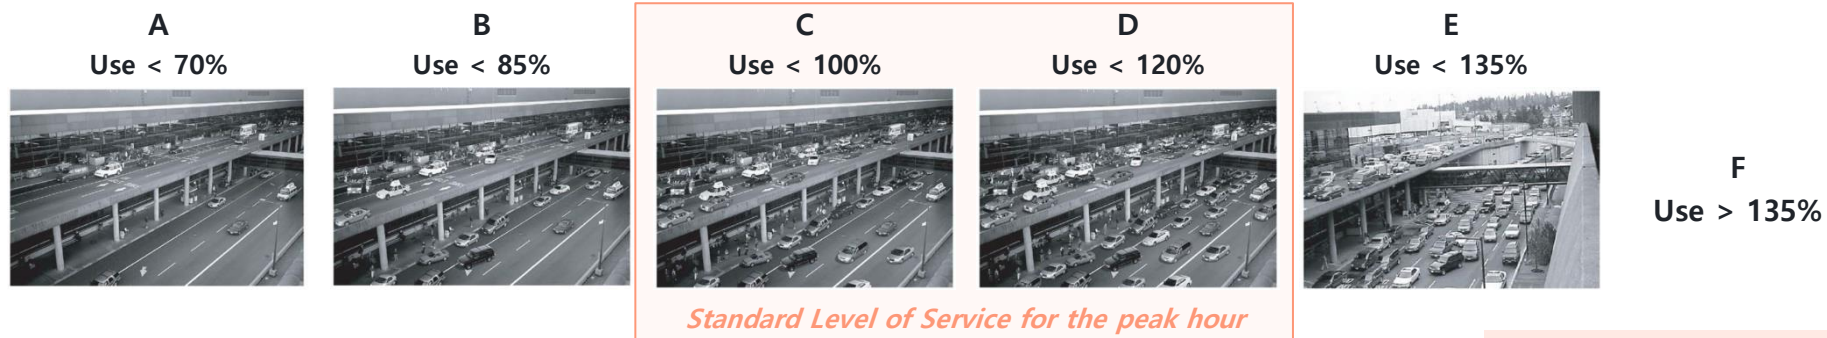

Source: TCIAA Curbside traffic survey (July 2022), ACRP 40, ALG analysis

Note: An average speed of 56 km/h has been considered

# Both terminal access curbsides are currently congested and expected to continue showing signs of saturation

## Curbside capacity-demand analysis

Existing length and curbside use

- Preliminary results show **congestion of the departures and arrivals access curbside**
- **Operational measures** (access & parking restrictions, pay-per-use, etc.) **could mitigate the curbside saturation but departures curbside already shows congestion in 2022**

Source: TCIAA Curbside traffic survey (July 2022), ACRP 40, ALG analysis

The airport has a public car parking which accommodates private car & car rental, employees' cars and buses/minivans

### Car parking current situation

Source: Google Earth, ALG analysis

# Taxi car parking facilities require expansion works in the short/mid term while public parking spaces are enough to cope with the demand

## Car parking capacity-demand analysis

Private car & car rental   Airport transfer   VIP   Employees   Taxi

### Public car parking including employees, bus, and car rental (spaces)

### Taxi (spaces)

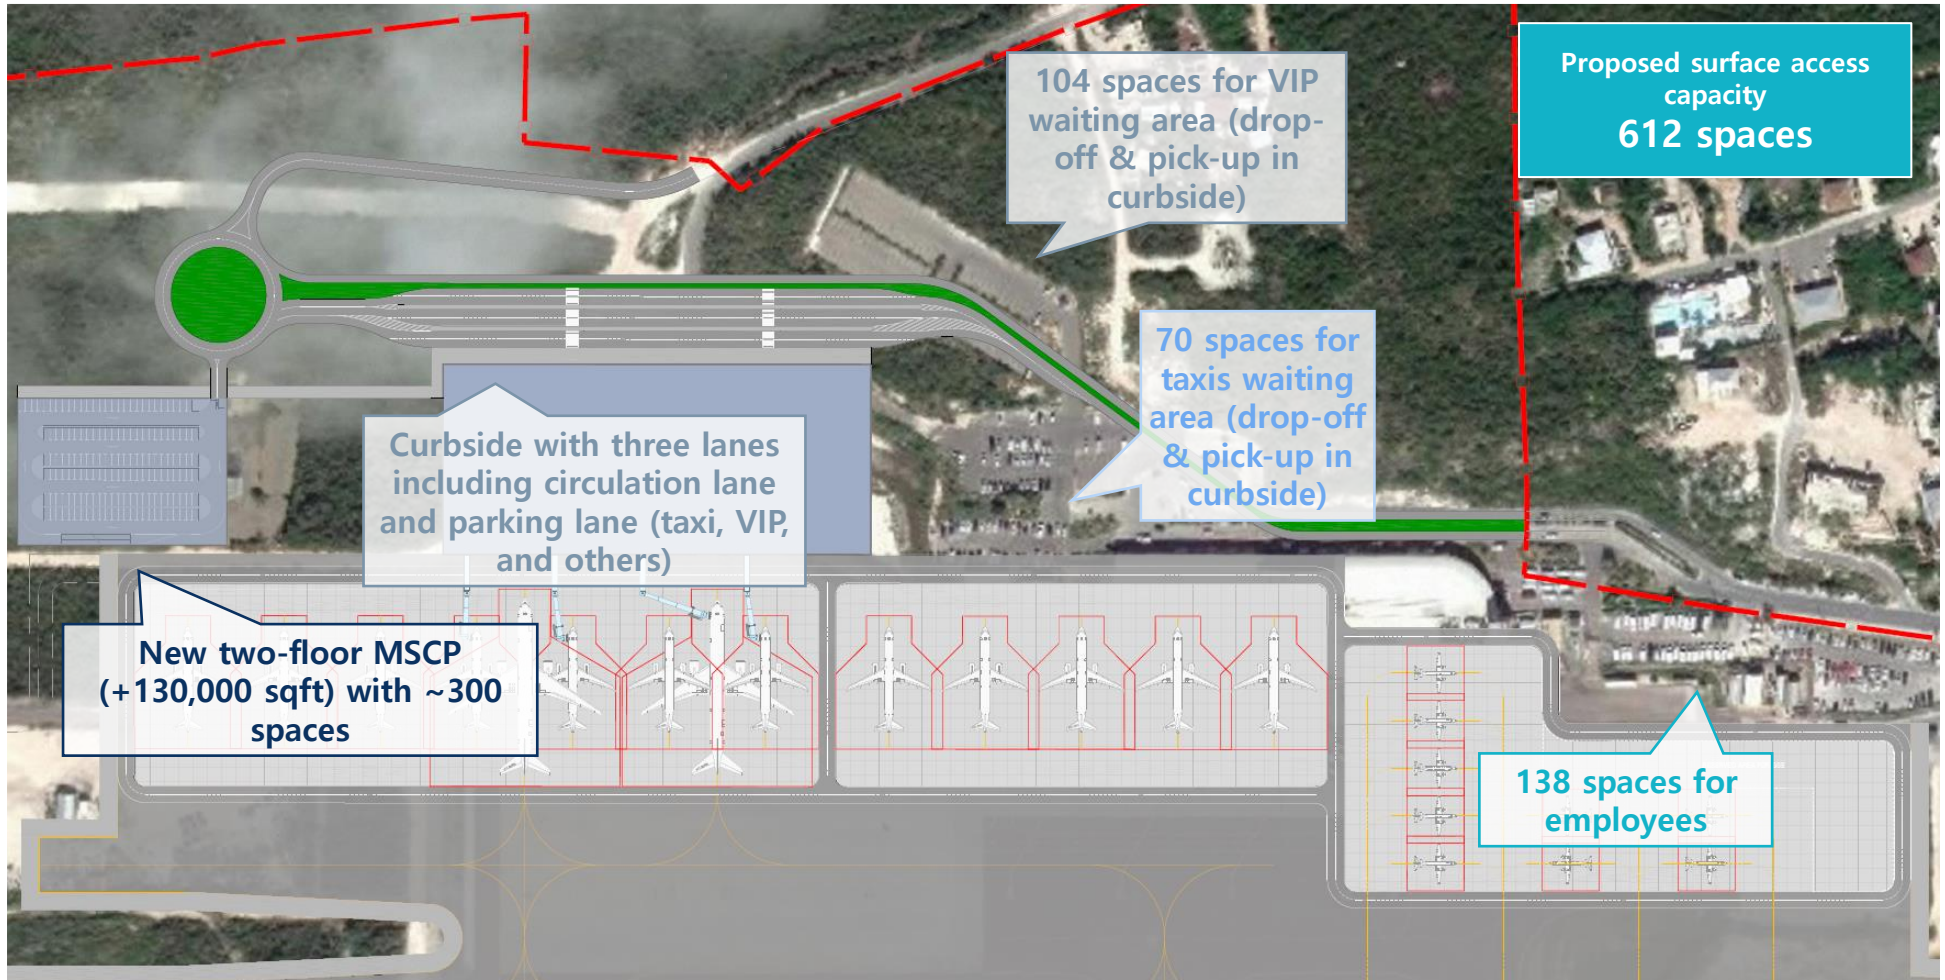

Source: TCIAA Curbside traffic survey (July 2022), Google Earth, ALG analysis

No congestion   Full capacity   Congestion   Strong congestion   Saturation

The surface access development plan is aligned with the construction of the new terminal providing an overall car parking capacity of ~610 spaces

### Surface access proposed development

## CHAPTER

# 5.1

Introduction

Current infrastructure condition & compliance

Capacity-demand analysis

Infrastructure development plan

**Investment program**

- **Methodology**
- Results

# The investment strategy has been defined under three categories of investment: expansion CapEx, compliance CapEx, and maintenance CapEx

## Types of investments and responsibilities of the private investor

| Investments   | Driver   | Obligatory nature  |
|---|--|--|
|  <p><b>Expansion CapEx.</b> Investment actions required in order to develop the airport's infrastructure and its processing capacity, and in general, the addition of new infrastructure, equipment or systems not previously existing</p>    | <p><b>Demand evolution</b><br/>(<i>triggers: PHP/stands/Mpax</i>)</p>      | <p><b>Mandatory investments</b> linked to <b>demand triggers or pre-identified current needs</b>, whichever comes first</p>  |
|  <p><b>Compliance CapEx.</b> To align the airport's infrastructure to the standard and recommended practices (SARPs) of ICAO mainly regarding the safety and security of the operation. This type of investment will adopt the form of capital investment actions or major maintenance and replacement actions</p>   | <p><b>Pre-identified non-compliances</b></p>                               | <p><b>Mandatory investments in the first four years</b> of the concession</p>  |
|  <p><b>Maintenance CapEx.</b> Also referred to as "Maintenance and Replacement Investments" required to maintain the good and safe operating condition of existing infrastructure. Major maintenance actions may also be required to ensure regulatory compliance (e.g. major rehabilitation of a runway, taxiway or apron pavement to ensure the safe operation of aircraft)</p>  | <p><b>Lifecycle of assets, last intervention and current condition</b></p> | <p>A <b>minimum maintenance plan is requested from the bidder</b> as well as a commitment to carry out the proposed plan</p> |

# Benchmark of main unit costs on Caribbean airport projects and ALG hypothesis: Airfield resurfacing works

## RWY resurfacing benchmark

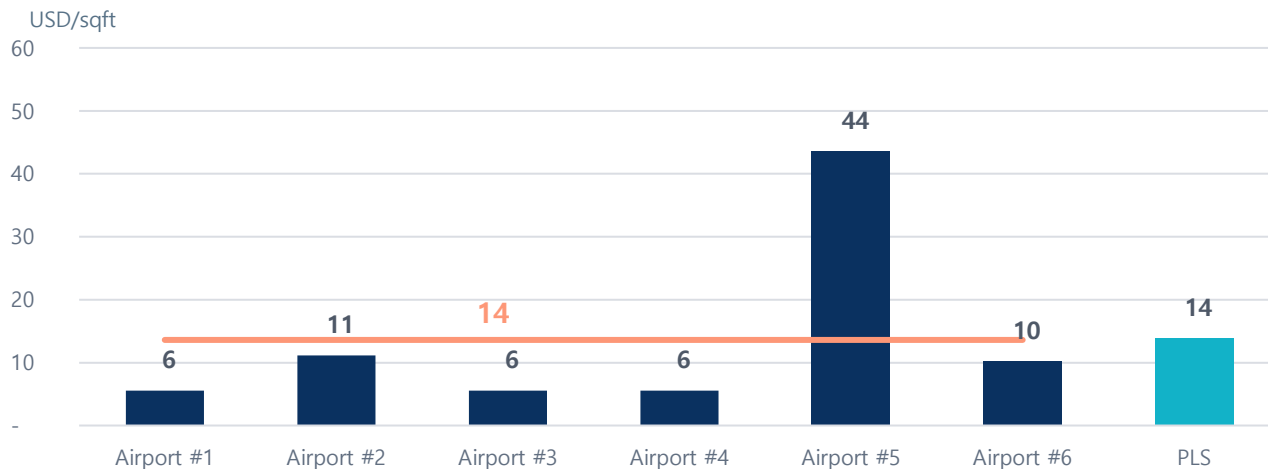

### RWY resurfacing

The proposed unit cost for PLS (16 USD/ft<sup>2</sup>) is aligned with the region's benchmark average based on:

- Short construction works duration
- Highly dependent on machinery and less on construction materials
- Less massive manpower requirements to perform the works

## TWY resurfacing benchmark

### TWY resurfacing

The proposed unit cost for PLS (14 USD/ft<sup>2</sup>) is aligned with the region's benchmark average based on:

- Short construction works duration
- Highly dependent on machinery and less on construction materials
- Less massive manpower requirements to perform the works

# Benchmark of main unit costs on Caribbean airport projects and ALG hypothesis: Airfield construction/expansion works

## Apron construction/expansion benchmark

### Apron construction/expansion

The proposed unit cost for PLS (71 USD/ft<sup>2</sup>) is ~65% higher than the region's benchmark average based on:

- Mid/long construction works duration
- Highly dependent on construction materials
- Massive manpower requirements to perform the works

## TWY construction/expansion benchmark

### TWY construction/expansion

The proposed unit cost for PLS (51 USD/ft<sup>2</sup>) is ~65% higher than the region's benchmark average based on:

- Mid/long construction works duration
- Highly dependent on construction materials
- Massive manpower requirements to perform the works

# Benchmark of main unit costs on Caribbean airport projects and ALG hypothesis: Landside construction works (terminal, PBBs, and surface car park)

## Terminal expansion/construction benchmark

## PBBs benchmark

## Surface car park construction/expansion benchmark

## CHAPTER

# 5.2

Introduction

Current infrastructure condition & compliance

Capacity-demand analysis

Infrastructure development plan

Investment program

- Methodology
- Results

Two different scenarios have been modelled: (1) Status Quo and (2) the entrance of a private specialized airport operator

|                                      | STATUS QUO SCENARIO   | PRIVATE OPERATOR SCENARIO   |
|--------------------------------------|---|---|
| Ownership                            |    |                          |
| Studied period                       | 30 years  | 30 years  |
| Operation, Maintenance, Construction |  + Technical Service Agreement (TSA) – O&M<br>+ ORAT contract – construction | Renowned International Airport Operator   |
| Finance mechanism                    |  100% Debt (Sovereign project guarantee)                                     | Private: 70% Debt / 30% Equity for Expansion CapEx  |
|                                      | No impact on country's debt   |   |
| Government remuneration              | TCIAA Dividends   | PPP revenue share   |
| Risk assessment                      | All risks remain on TCIAA   | Relevant risk transferred to the Private Entity (design, construction delays, demand, operating cost, etc.) |

Source: ALG analysis

PLS would require an investment of USD 363m for the concession period, accounting expansion CapEx for 82% of total investment (USD 290m)

**Investment plan** (Million USD, constant values 2021, 2022-2053)

|                          | 2023-2024 | 2025-2028  | 2029-2053 | Total 2023-2053   |
|--------------------------|-----------|------------|-----------|-------------------|
| <b>Expansion CapEx</b>   | USD 94.1m | USD 204.0m | -         | USD 298.1m        |
| <b>Compliance CapEx</b>  | -         | -          | -         | -                 |
| <b>Maintenance CapEx</b> | USD 5.3m  | USD 11.8m  | USD 47.7m | USD 64.8m         |
| <b>Total 2023-2053</b>   | USD 99.4m | USD 215.8m | USD 47.7m | <b>USD 362.9m</b> |

Source: ALG analysis

The largest expenditure of the expansion CapEx is the construction of the new Terminal Building, with a total value of USD 169.4m (~60% of total CapEx)

**Expansion CapEx plan by category** (Million USD, constant values 2021, 2022-2053)

Million USD

- Expansion CapEx is allocated at the beginning of the concession from 2024 to 2028
- The construction of the **new PTB (270,000 ft<sup>2</sup>) is the main expenditure of the concession and its costs is spread over four years (2024-2027)**
- The **major investment on the apron is in 2024** driven by the construction of the three code C stands (west)
- Investment in a **new turn pad and new TWYs for ARR and DEPs** is required between 2023 and 2028 in order to **increase runway’s capacity to accommodate the expected hourly demand**
- Other costs include preliminary studies (5%) and contingencies (5%)

Source: ALG analysis

The largest expenditure of the maintenance CapEx is the repaving of the RWY & TWYs, with a total value of USD 31.3m (~50% of total maintenance CapEx)

**Maintenance CapEx plan by category** (Million USD, constant values 2021, 2022-2053)

| Maintenance CapEx  | Total (M USD) | %   |
|--------------------|---------------|-----|
| RWY and TWYs       | 31.3          | 48% |
| Apron              | 13.1          | 20% |
| Terminal           | 2.1           | 3%  |
| Parking and access | 2.2           | 3%  |
| Support facilities | 10.3          | 16% |
| Other              | 5.9           | 9%  |
| <b>Total</b>       | <b>64.8</b>   |     |

Source: ALG analysis

An additional 15% increase has been considered in case of being performed directly by TCIAA, resulting in USD 417.3m investment program

**Investment plan** (Million USD, constant values 2021, 2022-2053)

|                          | 2023-2024  | 2025-2028  | 2029-2053 | Total 2023-2053   |
|--------------------------|------------|------------|-----------|-------------------|
| <b>Expansion CapEx</b>   | USD 108.2m | USD 234.6m | -         | USD 342.8m        |
| <b>Compliance CapEx</b>  | -          | -          | -         | -                 |
